September 29th - 30th, 2016 Palmeraie Golf Palace, Marrakesh

29 - 30 septembre 2016 Palmeraie Golf Palace, Marrakech

HIGH-LEVEL MEETING ON THE INITIATIVE FOR THE ADAPTATION OF AFRICAN AGRICULTURE TO CLIMATE CHANGE "AAA"

RENCONTRE DE HAUT NIVEAU SUR L'INITIATIVE POUR L'ADAPTATION DE L'AGRICULTURE AFRICAINE AUX CHANGEMENTS CLIMATIQUES "AAA"

JEREMY BIRD

Director General of the International Water Management Institute (Colombo, Sri Lanka)

Adapt and Mitigate: Examples from IWMI's work on water related climate challenges in Africa

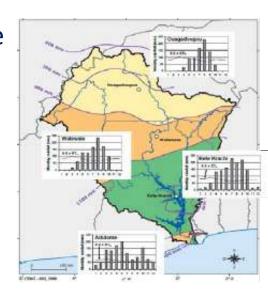

Water, Land and

Ecosystems

Agricultural livelihoods and climate change

- ➤ 62% of population in SSA is reliant on agriculture for their livelihoods
- > ~ 80% are smallholders and a large proportion women due to urban male migration
- Production is currently low, dependent on variable rainfall leading to high levels of vulnerability (e.g. 80% in West Africa)
- ➤ Land degradation is significant compromising future productive capacity and ecosystem services
- Investment in agriculture can address multiple SDGs (food, nutrition, poverty, etc.)

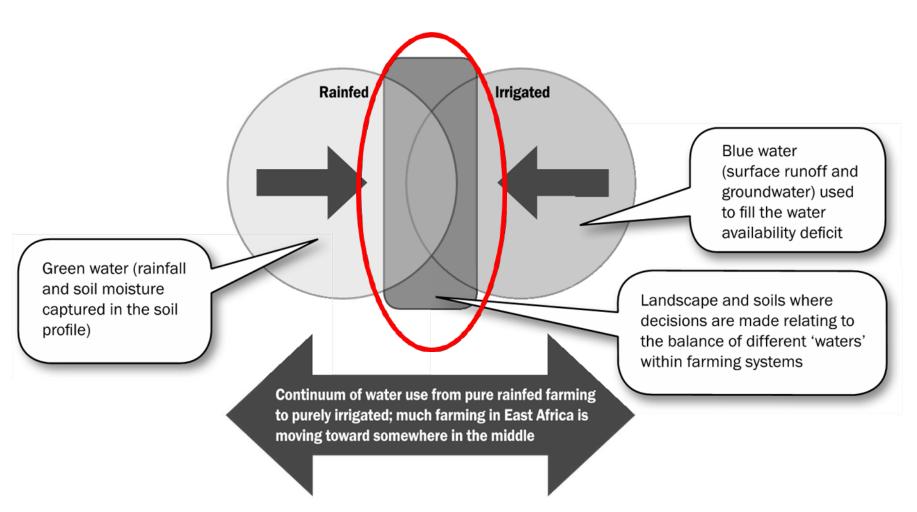

A water-secure world

Adaptation focus of IPCC

- ➤ Adaptation will bring **immediate benefits** and reduce the impacts of climate change
- > Adaptation is fundamentally about risk management
- > Adaptation experience in Africa is growing
- Africa stands to benefit from **integrated** climate adaptation, mitigation and development approaches
- International cooperation is vital

Source: IPCC AR5

Towards climate and water smart agriculture

Moving along the pathway from rainfed to irrigated

- Encourage productivity increases and multiple cropping
- Redress land degradation and lost fertility
- Requires a landscape (watershed) approach

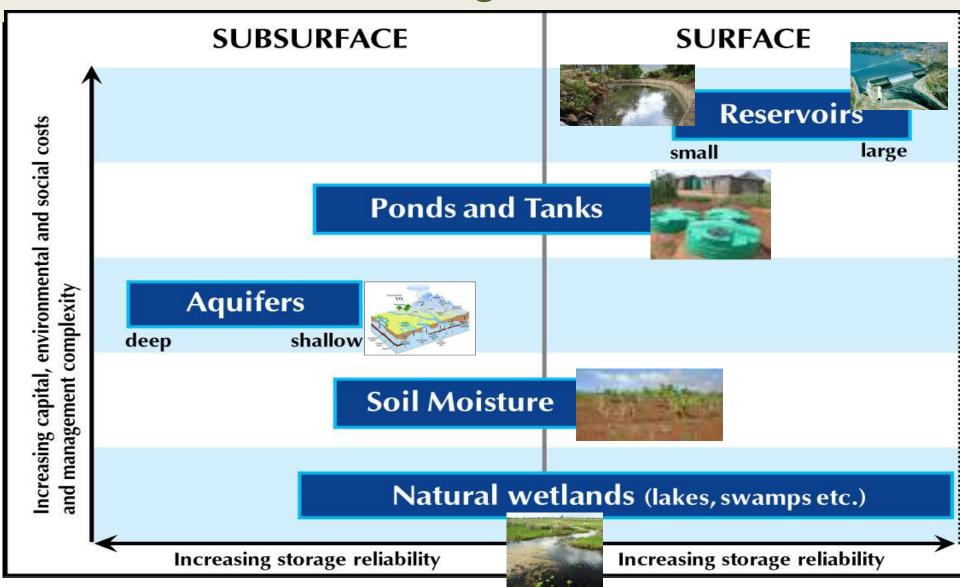

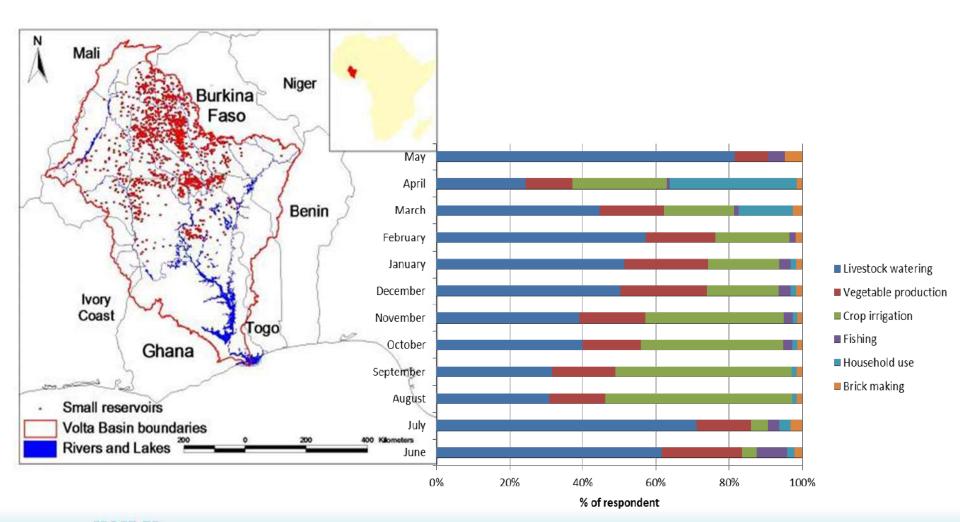

Consider all forms of storage to increase resilience

Source: McCartney & Smakhtin 2010

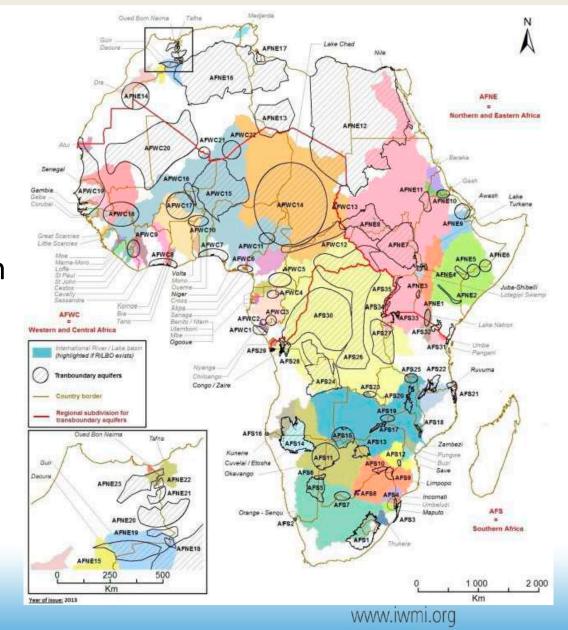

Small reservoirs can increase resilience – have multiple uses

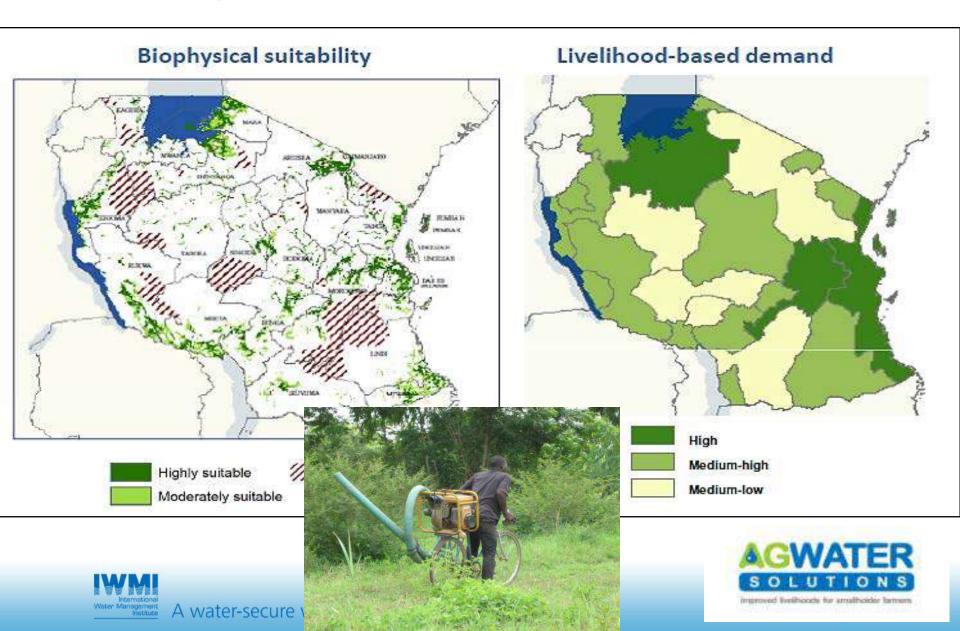

Significant groundwater potential exists in Africa

- ➤ Groundwater reserves in Africa are 20 times storage in lakes
- Pumps could benefit185 million people withUSD 22bn value
- ➤ But knowledge base and means of access lacking
- > How sustainable?

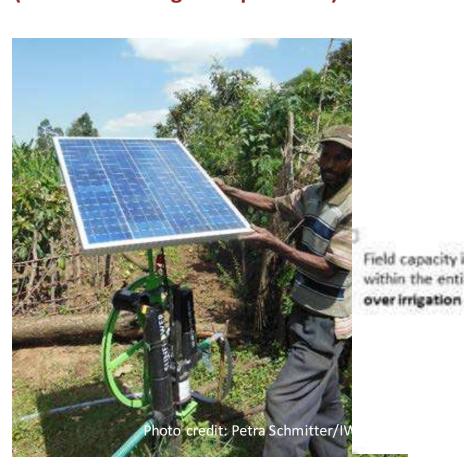

Tanzania – from bucket to pump – facilitating entry into the irrigation market

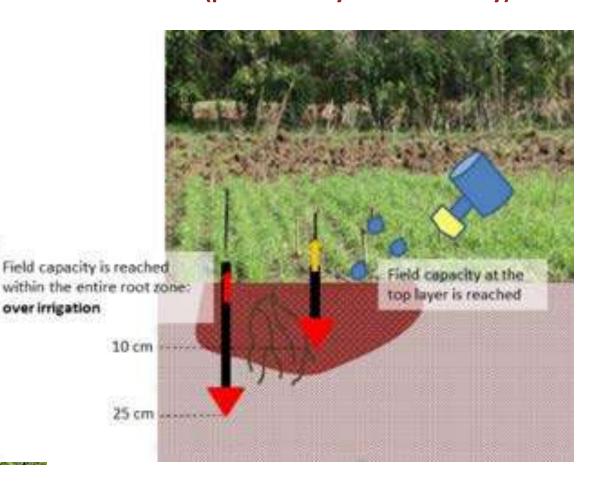

Scope for new technology

Solar Pumps (access and mitigation potential)

Wetting Front Detector (productivity and efficiency)

A water-secure world

Improved livelihoods – more than just water

Increase access to water 2

Catalyse smallholder value chains

3

Create policy synergies between sectors

Take a watershed perspective

Rainwater harvesting

- · Create suitability maps
- · Show farmers the benefits
- · Garner local support
- · Provide loan capital
- Offer smart subsidies
- Provide technical support

Shallow groundwater

- Map groundwater resources
- · Develop affordable drilling
- Raise awareness and create demand
- · Monitor environmental risks

Small reservoirs

- Reduce investment costs
- Pilot new management approaches
- Acknowledge multiple uses

Innovative financing mechanisms

- Pilot financial instruments
- · Support rental markets
- Explore irrigation service providers' model
- Link specialist financing to existing programmes
- Encourage women to own equipment

Helping farmers buy equipment and become profitable

- Provide better information
- Educate about marketing
- Provide crop storage facilities
- Promote 'try-before-youbuy' schemes
- Use networks to disseminate information

Addressing the influence of external sector policies

- Align energy, import and water policies
- Develop alternative energy sources
- Privatize procurement and marketing of irrigation equipment
- Review tax policies and import duties

Managing social and environmental impacts

- Consider multiple AWM investments
- Develop systems to promote cooperation
- Improve evaluation of investments
- View impacts in broad context

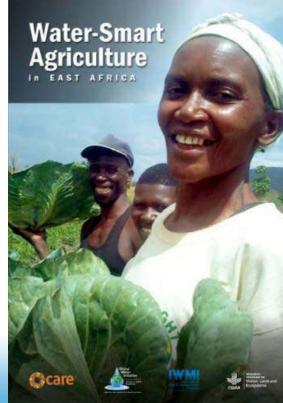

A water-secure world

www.iwmi.org

Importance of targeting women in AWM solutions

- In sub-Saharan Africa more than 60% of all female employment is in agriculture.
- yet women lack access to finance, inputs, extension services and information
- less than 5% of motor pump owners are female
- Urban male migration and ageing population is leading to the feminization of smallholder agriculture

Nutrition benefits of small scale irrigation

	Ethiopia		Tanzania	
	Non-irrigators n=185	Irrigators n=284	Non-irrigators n=224	Irrigators n=227
Household food insecurity	Mean	Mean	Mean	Mean
access scale, 0-27 [higher means worse]	5.78	4.04	3.92	2.58
Female dietary diversity score: number of categories consumed	3.69	3.58	3.71	4.20
Household dietary diversity: number of food categories consumed	5.69	6.06	4.88	5.63

Groundwater Solutions Initiative for Policy and Practice (GRIPP)

Themes

- 1. Groundwater and Food Security
- Groundwater for Sustainable Development
- 3. Groundwater, Water Security and Climate Change Adaptation
- 4. Groundwater and Energy
- 5. Transboundary Aquifers
- 6. Groundwater Governance

Promoting dialogue on groundwater governance in the MENA region

What are the governance options available for different contexts, and how can we make them work?

Outputs:

- Regional dialogue on groundwater governance
- A participatory approach to the coconstruction of solutions
- Knowledge products on groundwater governance

Partners:

IWMI, ICBA LRBA (Lebanon) INRGREF (Tunisia) University of Jordan LISODE (France) **Consultants**

Solar irrigation – will aquifer levels keep declining? ...or is there an opportunity to recover?

Feed excess electricity into grid

Triple wins:

- Reduction in greenhouse gas emissions
- Sustainable use of groundwater
- Higher income to farmers

The opportunity

- Carbon mitigation replacing 130,000
 GW of electric and diesel tube wells
- Water savings incentivize through feed-in tariff to sell excess electricity to grid

Engagement in regional initiatives and new approaches to irrigated agriculture

PUBLIC PRIVATE PARTNERSHIPS FOR

WHIN BETHER AND RUTH MENZEN-DICK

ublic Private Partnerships for irrigation and other financing fature agricultural and overall economic development and was part of the 'tookit' of the Third International Conference on Financing for Development that took place in Addia Ababa in July 2015 to approve a framework for financially pporting the Sustainable Development Goals and the post-2015 Agenda. However, the Outcome Document of the Conference*1 cautioned that such projects "should share risks and reward fairly, belode clear accountability machinisms and meet social and remental standards" and outlined a need to "build capacity to enter into public-private partnerships, including with regard to budgeting for contingent liabilities". This policy note offers guidance on how to work toward these objectives, presenting emerging findings from a research project implemented by \$790 together with partners from Ghana and Tanzania, investigating Models of Public Private Partnerships for Irrigation Development. It attempts to identify the institutional arrangements that can best meet the social, development, and environmental objectives of PPPs.

PUBLIC PRIVATE PARTNERSHIPS: A TOOL FOR DEVELOPMENT?

irrigation offers the potential to increase productivity, food and nutrition security, and resilience to climate shocks, but the high cost of irrigation together with the fiscal constraints faced by many African governments constrain the development of infration. Public Private Partnerships (PPPs) offer a potential institutional arrangement to mobilize additional resources—including financial technical, and managerial-from the private sector for critical investments in infection, and how been highlighted in a number of strategies (both in developing countries and at the international level) as integral to the development and expension of agricultural ortanities. However, despite the recent interest in PPPs for agricultural development and expending irrigation, and the

and investment, there are few studies and there is little available evidence as to what works, the different institutional arranger and how best to balance competing economic social, an anyleynmatrial goals.

CHALLENGES FOR PPP IN IRRIGATION

While there is limited experience with PIPs for infgetion, previou experience with municipal water supply and large-scale agricultura land cautions against assuming that PPPs are appropriate for all situations. In particular, attention should be paid to the social implications of such deals as previous PPP experiences suggest that countries, while in need of investment, may not have the necessar capacity and knowledge base to regotiate on a level-playing fel with private sector interests promising large investments.

private investors, which could even be construed as land or water "grebs" as a result of the different capacities in negotiatio eteren investor and recipient of the investment, Efforts to surage and facilitate private sector or direct investment, for example, through securing property rights for investors at the espense of local community members, may have long-tern edverse economic and social consequences, including loss of access to land and resources, increased social tensions, and a erosion of government oversight and accountability

- Difficulty in aligning development and profi
- objectives inherent risks in agriculture

- water uses, under climate change
- Land and water rights
- Priorities for Inve

Fecal Sludge Management and Agricultural Reuse

Dimensions of Climate Smart Agriculture

CLIMATE SMART VILLAGE / FARM

- Sustainably increasing agricultural productivity and incomes
- Adapting and building resilience to climate change
- Reducing and/or removing greenhouse gas emission, where possible.

FAO, 2013

Improving productivity of soils and quantifying carbon capture

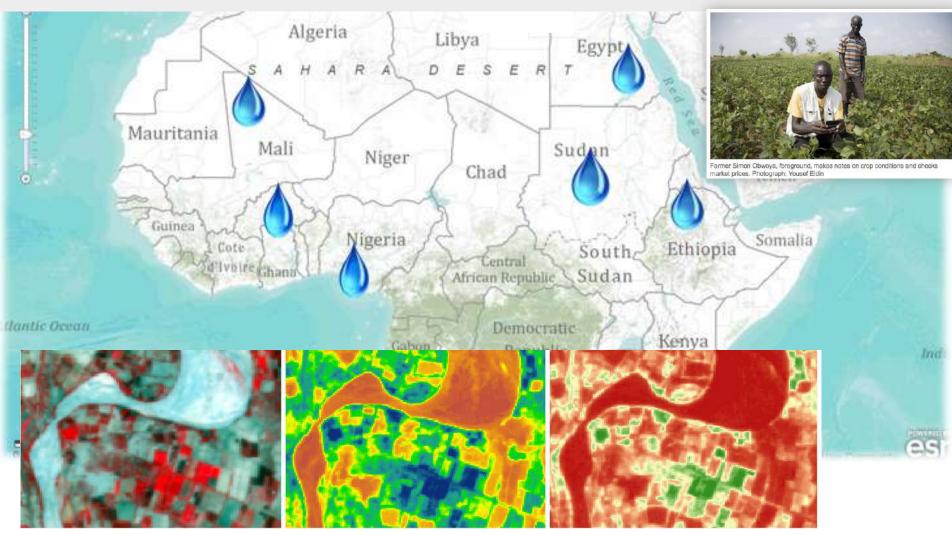

- Continent wide initiative on Africa Soil Information Service (ICRAF)
- One acre fund to provide services to 180,000 farmers in Eastern Africa; India planning to support 3M soil analyses over 3 years
- ➤ 4 per 1000 initiative signed at COP21 to increase global soil carbon stocks (CIAT)
- ▶ Potential for 265 million tCO₂ per year up to 2030 to be harnessed (through cropland management, grazing land management and the restoration of degraded lands). (FAO, 2012: 23).

Piloting spatial data based information systems for smallholders

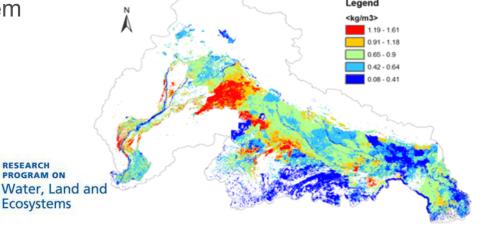

A water-secure world

Water accounting plus – understanding the status of water resources

www.wateraccounting.org

- Based on remote sensing and global hydrological models to better understand state of water resources, issues and challenges/opportunities
- Contextualizes water accounting by including sustainability and ecosystem services dimensions
- Allows users to understand impacts and trade-offs of different interventions

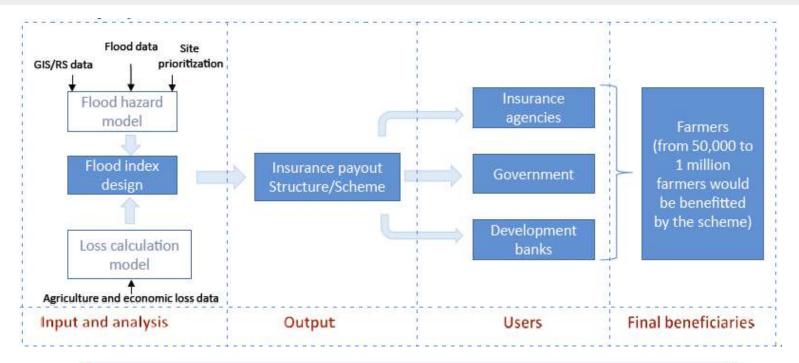

Index-based flood insurance – partnership with the insurance industry

If the solutions proposed by the project are scaled up, by 2025, approximately 1 million farmers will have agricultural flood insurance, creating new and different types of jobs supported by strong public-private-partnership business models and delivering INR 10 billion in flood protection.

Project partners

Some reflections

- Small scale irrigation continues to grow in SSA but slowly
- > SSI has potential for wider benefits beyond yields and income if climate resilience, health, nutrition, and gender considerations are actively promoted,
- Needs support for input and output markets, credit, insurance, timely information, institutional and regulatory reform
- Need to assess the basin/aquifer scale consequences of expanding CSA solutions
- ➤ Reinforce farmers own adaptation strategies with innovations in science and technology (crop varieties and livestock breeds, efficient water storage and management, ecosystem based approaches, etc.)

Source: IPCC AR5

Overcoming barriers

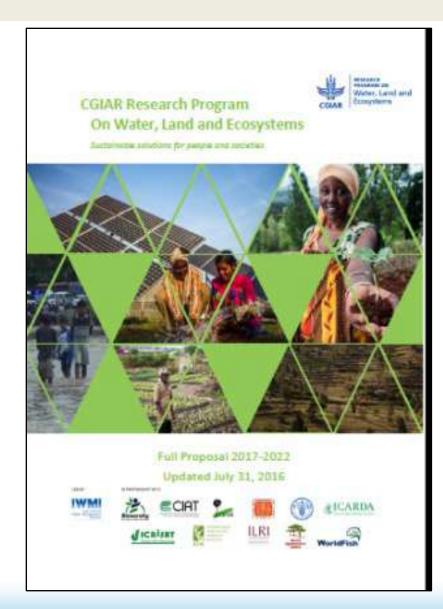

- ➤ Identify institutional home to support small scale and supplementary irrigation technologies and support services (often falls between agriculture and irrigation/water agencies)
- Clarifying the business model and incentive structures (smallholder, PPP, ...)
- Remove gender disparities in regulatory and administrative processes
- > Improving access to credit
- Raise awareness and build capacity of women) and agency staff
